Simplify (Write the answer using only POSITIVE EXPONENTS):

\*21.  $\frac{2^2}{2^{-5}}$

$\frac{2^2 \cdot 2^5}{1}$

When a negative (inverse) exponent appears in a fraction, move it to the **other side** of the fraction bar (with the number attached to it) and make the exponent **positive**

$2^7 = 128$

\*22.  $\frac{a^7x^{-5}}{a^5x^4y^{-2}}$

$\frac{a^7y^2}{a^5x^4x^5}$

Move the numbers with negative exponents to the other side of the fraction bar to make the exponents positive, then simplify

$\frac{a^2y^2}{x^9}$

23.  $\frac{2^2}{2^{-3}}$

24.  $\frac{2^{-5}}{2^{-2}}$

25.  $\left(\frac{x^2}{y^3}\right)^{-2}$
